

Project specification

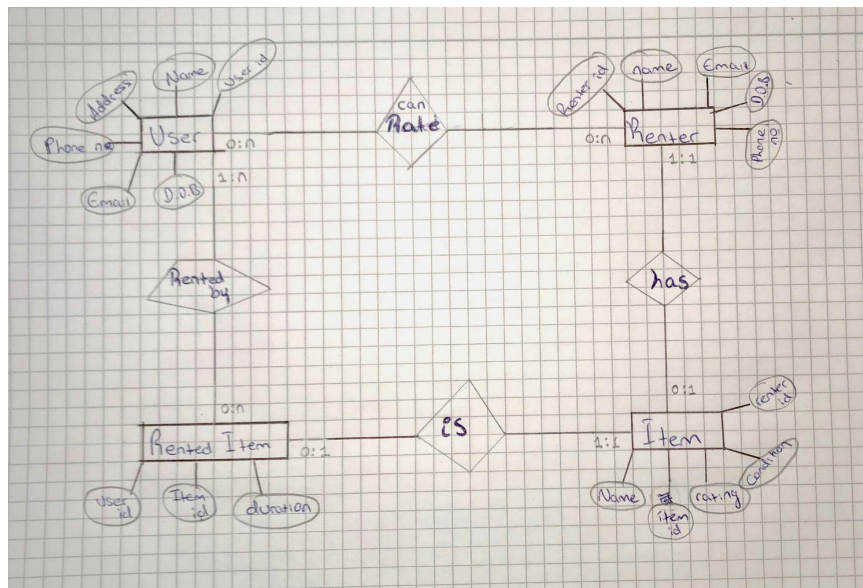

Functionality:

There's gonna be two types of users, Renter and Customers.

From the customers perspective: Users register or login, then they're gonna see a list of items to be rented. The list shows for each item the name, category, location and other other relevant information. They'll also be able to search for an item or category. After that, if they decide to rent they go to the item page and they can select a payment method and rent it. Customers can also check the status of an already rented item like when they have to return it. At the end, the customer can rate the renter and also check their rating.

From the renters perspective: Renters register or login, they can add an item they want to rent. They add the name, image, availability, price, and other details of the item. They can see the status of the rented items. The renter can also rate the customer and also check their rating.

ER Diagram:

User Experience:

- The user can create an account
- The user can see a list of items that are offered up for rent
- The user can search for a specific item or a category of item
- The user can see the specific page for an item which will show the price per hour and the rating of the item
- An illegal action is a user trying to rent an item that has already been rented
- An illegal action is a user setting a rent time outside the times specified by the listing
